

HOSTING SERVICES

Savvis Cloud Compute

Savvis Cloud Compute expands on Savvis' rich heritage of delivering global IT infrastructure-as-a-service to thousands of businesses throughout the world. Savvis Cloud Compute takes the utility concept even further by combining virtualization technology from VMware®, an industry leader, with our dedicated and shared hosting platforms. Customers are empowered with easy-to-use tools to provision new instances online as they need them based on short, flexible term commitments. This powerful combination equips your business with the tools to rapidly build, control, and customize your hosting environment to support the demands placed on your infrastructure without the burden of long-term contracts or the lead time of traditional deployments.

What's more, Savvis Cloud Compute eliminates the capital burden of investing in expensive physical server deployments that often go underutilized. As a pioneering provider of utility and virtualized services for the enterprise, we understand that the demand on your compute resources is dynamic and always shifting, and that although some demands are predictable, many are not. Every component of Savvis Cloud Compute is based on the notion that you should be able to deploy compute resources quickly and easily when you need them and turn them off when you don't.

Savvis Cloud Compute offers enterprises a compelling opportunity to reshape their hosting environment to a more scalable and cost-efficient operating model without sacrificing security or performance.

Savvis Cloud Compute: Flexible, Scalable, and Always Available

Savvis understands that flexibility is an essential component of any utility solution. We offer scalable, agile compute solutions in either a shared or dedicated environment, depending on your needs. Our cloud server instances act just like physical servers and run your applications just like you are used to. Because they are built upon a fully redundant architecture, Savvis Cloud Compute services are designed to eliminate downtime due to hardware failure. And our dynamic architecture can move instances between physical servers without service interruption to keep your Web site and applications up and running without compromising performance.

Savvis Cloud Compute Advantages

- Pay-by-the-instance model
- Customer-controlled online instance provisioning in minutes
- Flexible business terms
- Scalable infrastructure
- Granular scalability
- Enterprise-class reliability

Savvis Dedicated Cloud Compute delivers a fully dedicated virtualized compute environment hosted from our state-of-the-art data centers and managed by our hosting professionals.

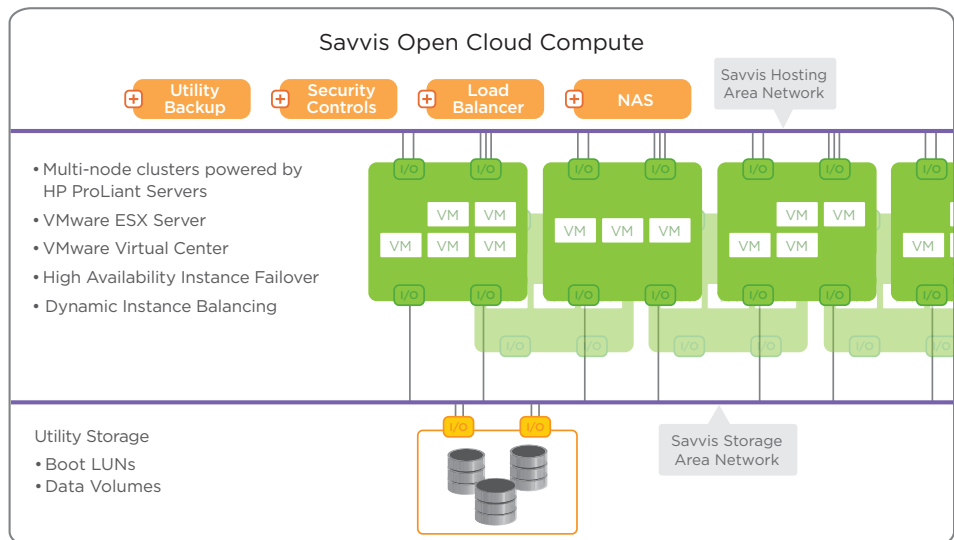

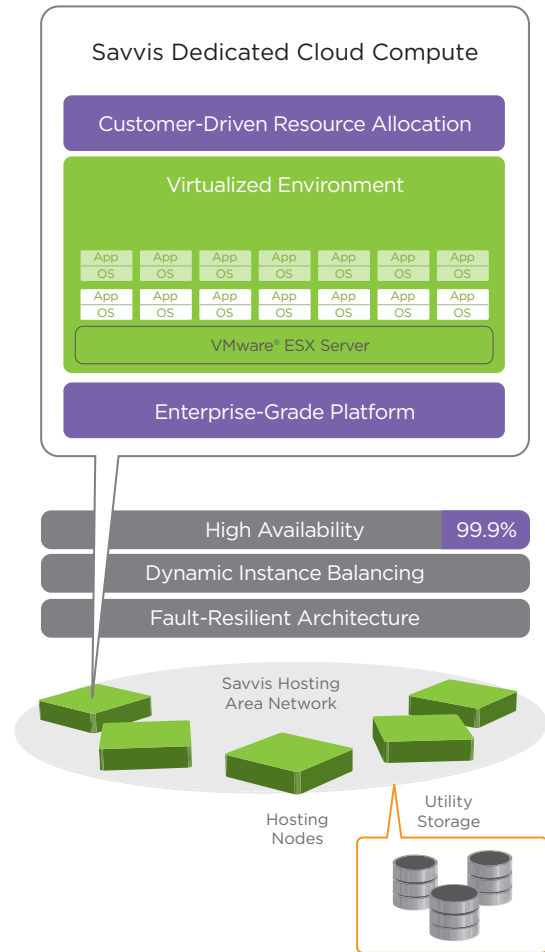

Using virtualization technology powered by VMware, your Savvis Dedicated Cloud Compute solution can be partitioned into multiple self-contained virtual machines, each capable of running its own operating system and set of applications, dramatically reducing the high cost and management hassles that accompany server sprawl.

Once deployed, you can easily add instances automatically through the SavvisStation Portal. Whether you're supporting seasonal site traffic on your web site, or expanding your test and development environments, Savvis Dedicated Cloud Compute can dramatically improve operational efficiencies while reducing the total cost of ownership (TCO) of having an enterprise-class environment dedicated to your needs.

Savvis Open Cloud Compute is built on a massively scalable, multi-tenant infrastructure and delivers a secure, enterprise-class cloud environment with built-in high availability and automated resource balancing.

Savvis Open Cloud Compute offers you the freedom of choosing a "right-sized" compute environment with a purchase-by-the-instance cost model. Add flexible month-to-month terms for each instance and you'll find that Savvis Open Cloud Compute delivers one of the highest levels of true utility computing in the market today.

Ideal for production and pre-production environments, We provide a scalable, agile infrastructure that gives you control through the SavvisStation Portal to add resources as you need them — in a matter of minutes, not days.

Put Yourself in the Driver's Seat

Savvis Cloud Compute gives you control. By providing a complete view of your infrastructure, our SavvisStation Portal makes it easy to deploy, configure, and manage your server and network infrastructure resources. Intuitive wizards help you customize and provision new server instances from a shared or dedicated pool of physical components, including managed operating systems, processing, memory and applications.

In addition, you can easily track all your orders, tickets, and invoices through the portal. And, to ensure security, Savvis allows you to strictly control who has access to SavvisStation Portal: you authorize your user community and define their level of access. Your authorized users can then securely access SavvisStation Portal from virtually anywhere in the world using either desktop or mobile devices.

Secure Your Applications and Data Without On-Premise Software or Hardware

Complementing your hosting environment with leading security services has never been easier. Our portfolio of security services benefit your company by providing flexible and scalable managed security offerings that can be added to your hosting solution to provide protection against threats to your environment. Our fully managed suite of security solutions includes managed firewall, network intrusion detection (NIDS), e-mail and web protection services and DDoS Mitigation.

Keep Your Systems Up and Running with Our Renowned Customer Support

From designing solutions to serve the most demanding hosting environments, to managing the everyday mechanics of your hosted infrastructure, commitment to customer service is our top priority. We've spent a decade integrating our systems and developing procedures that allow us to deploy your solution quickly. Once your solution is live, our certified staff of support professionals takes care of keeping it running at optimal performance so your IT staff can focus on issues that are more strategic to your business.

- **Operating system management.** Savvis will maintain the operating system, thoroughly testing each upgrade, service pack, and patch. Savvis will also work with you to distribute updates utilizing our proprietary inventory distribution capabilities.
- **Security patch deployment.** We deliver critical security patches and service packs to maintain the integrity and performance of your solution
- **Hot fixes and non-security patches.** We evaluate hot fixes and non-security patches to determine their urgency and impact, and follow the same rigorous guidelines for testing and integrating them as we do with service pack upgrades.

Savvis provides support that extends beyond the walls of our data centers and network operations center (NOC), and because we give you full visibility into your hosting environment, you always know the status of every component of your solution.

Savvis Dedicated Cloud Compute Features

- Dedicated infrastructure
- On-demand instance and storage provisioning
- Full capacity management and customizable monitoring
- High availability instance failover with 99.9% SLA
- HW optimization with Dynamic Instance Balancing
- Multi-OS environment

Savvis Open Cloud Compute Features

- Shared multi-tenant infrastructure
- Fractional computing resources by the instance
- Disk scalability in 50GB increments
- Automated resource balancing
- Flexible month-to-month business terms

About Savvis

Savvis, Inc. (NASDAQ:SVVS) is an outsourcing provider of managed computing and network infrastructure for IT applications. By outsourcing to Savvis, enterprises can focus on their core business while Savvis ensures the quality of their IT infrastructure. Leading IT organizations around the world have selected Savvis to help them improve their service levels, reduce capital expense and deal with the rising costs of bandwidth, energy, real estate, staff and expertise. As a pioneer in utility computing, Savvis understands and harnesses the latest advances in technology like virtualization, cloud computing and support process automation.
