Non-Deterministic Code is Hard

This code could return 3 different values (in other languages, 4 different values!)

```
1   class JeanPaulSartre(object):
2       x = 0
3       y = 0
4
5       def set(self):
6           self.x = 1
7           self.y = 2
8
9       def add(self):
10          return self.x + self.y
```

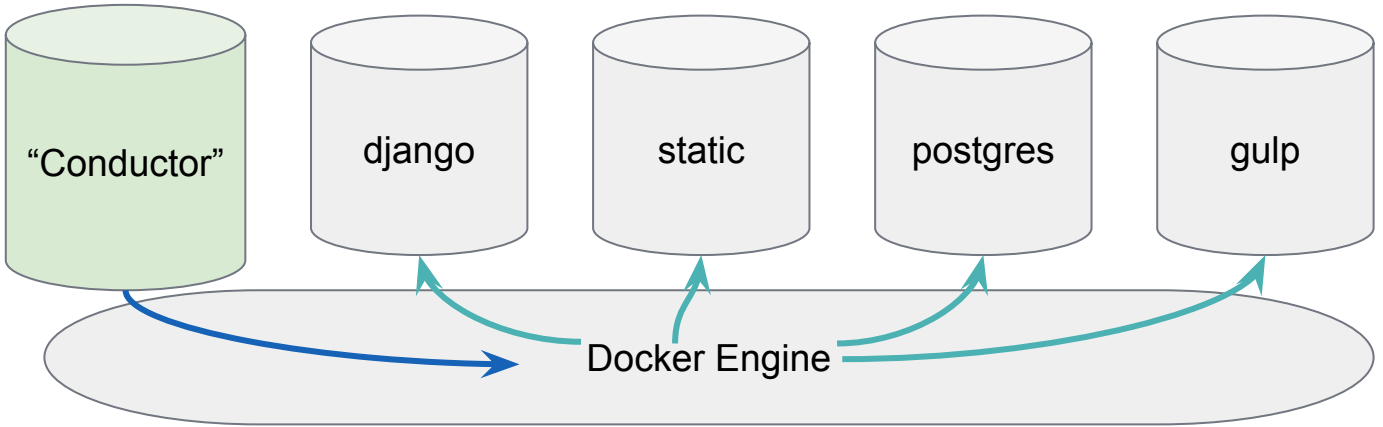
How Ansible Container Works

The basic theory...



- Uses Docker connection plugin to access hosts via the Docker Engine (no ssh)
- Brings Python runtime from Conductor into target containers, so no Python needed
